

Daena — Your AI Vice President

Sunflower-Honeycomb Governance + NBMF Memory + Enterprise-DNA

The Problem We Solve

Fragmentation

Today's AI stacks are fragmented. Disconnected tools don't coordinate, leading to data silos and operational chaos.

Lack of Governance

Executives can't audit who did what, with which data, or under which policy. This creates unacceptable compliance and security risks.

Exploding Costs

Costs explode at scale. Inefficient vector storage and unchecked token spend make widespread AI adoption financially unsustainable.

What Daena Is

An **AI Organization, not a tool**, built on our patent-pending **Sunflower-Honeycomb** architecture with 48 specialized agents across 8 departments.

Powered by **NBMF (Neural-Backed Memory Fabric)**, a three-tier memory system providing extreme compression and perfect recall.

Governed by **Enterprise-DNA**, a safety layer for defining agent capabilities, policies, and a complete, auditable lineage.

Orchestrated by a **Multi-LLM Brain** that uses "Think Mode" to route, debate, and merge insights from the best models for any task.

Sunflower-Honeycomb Architecture

- **An Organized Hive:** A human Founder in the center, with Daena as the AI VP orchestrating all departments.
- **Clear Roles & Responsibilities:** Each of the 8 departments contains 6 specialized agents (e.g., Advisors, Scouts, Synthesizer, Executor).
- **Structured Deliberation:** Decisions are made in phase-locked rounds: Scouts gather data, Advisors debate options, and the Executor commits the final action.
- **System Health:** Presence beacons and load-aware routing ensure optimal communication and prevent bottlenecks as the organization scales.

NBMF — Neural-Backed Memory Fabric

L1 Hot
(Instant Recall)

In-memory vector embeddings provide context for active decisions with **sub-millisecond latency**.¹

L2 Warm
(Efficient Storage)

Our patent-pending neural format achieves **13.30× lossless compression**, using CAS and SimHash to merge near-duplicates.¹

L3 Cold
(Durable Archive)

Immutable, highly compressed bundles provide cheap, long-term storage for complete auditability.

- **Cryptographic Lineage:** Every promotion between tiers is Merkle-notarized, creating an immutable audit trail that enables time-travel and instant rollback.

¹ Benchmarks based on internal tests using a mix of text, JSON, and multimodal documents on x86-64 CPU hardware. Full methodology available.

Enterprise-DNA Governance Layer

Genome

Defines the core capabilities, tools, and versioned behaviors available to each agent and department.
(What they can do).

Epigenome

Enforces tenant-specific policies, such as access control (ABAC), data residency, retention rules, and feature flags.
(What they are allowed to do).

Lineage

Creates a cryptographic, Merkle-notarized audit trail for every memory promotion and significant agent action. *(The unchangeable record of what they did).*

Immune System

Actively detects threats like prompt-injection and policy drift, automatically quarantining risks and enabling rollback. *(What they shouldn't do).*

Enterprise-DNA

Multi-LLM Orchestration (“Think Mode”)

- **Best Tool for the Job:** Intelligently routes tasks to the optimal LLM—GPT-4, Claude 3, Gemini, and others—based on the specific need.
- **Consensus, Not Dictation:** Agents engage in structured debate, comparing insights from multiple models to arrive at a synthesized, high-confidence answer.
- **Data-Safe by Design:** The Epigenome layer gates access to sensitive data, ensuring LLMs only see the minimum information required for a task.
- **Explainable Results:** Every final decision is backed by a complete lineage trail, showing the sources, debates, and consensus that produced it.

Evidence & MVP Status

MVP Deployed & Verified: Our system is live, **48** coordinating **48** agents across **8** departments with a real-time Founder dashboard.

Unmatched Performance: Achieved a huge, lossless compression and a **13.30x sub-millisecond** p95 latency in benchmark tests.¹

Radical Cost Savings: NBMF delivers over a **94%** storage and token cost savings compared to standard vector databases.²

Governed & Auditable: Prototype lineage viewer successfully tracks Merkle-notarized memory promotions.

^{1 2} Benchmarks based on internal tests using a mix of text, JSON, and multimodal documents on x86-64 CPU hardware. Full methodology available.

The Product Experience

CEO Control Center: A single pane of glass to set goals, create or retire agents, and inspect decision lineage across the entire organization.

Department Views: Drill down into specific departments to observe agent debates, review data sources, and check confidence scores in real-time.

Enterprise Ready: Designed for seamless integration with secure tenant isolation, a full suite of APIs and webhooks, and audit-ready data exports.

Market & Why Now

- **Massive & Growing Market:**
The Autonomous Agents market is projected to reach \$1.2 Trillion by 2030, but adoption is stalled.
- **The Critical Missing Piece:**
Enterprises desperately need governance, auditability, and cost control before they can deploy AI agents at scale.
- **Our Defensible Moat:**
Our patent-pending memory, governance, and organizational architecture provides a powerful and protected competitive advantage.
- **Proven Demand:**
We are already in discussions for early pilots with leaders in finance, healthcare, and govtech who recognize this need.

Business Model & Go-to-Market

Hybrid Revenue Model:

- **SaaS Subscriptions:** Tiered plans based on agents and memory usage.
- **Enterprise Licensing:** For private cloud deployments and custom needs.
- **Platform Fees:** API usage and future Agent Marketplace commissions.

Go-to-Market Strategy: Land & Expand

Land

- We target compliance and risk officers, landing initial deals based on our unique governance, audit, and cost-saving capabilities.

Expand

- Once inside, we expand usage across departments by demonstrating clear ROI and operational efficiency.

Predictable Pricing: NBMF's efficiency allows us to offer predictable, value-based pricing that dramatically undercuts the chaotic costs of competitors.

Our Roadmap

V11 (Now)

- Stable Founder dashboard, core governance and memory fabric, multi-LLM orchestration, and voice interaction capabilities.

Next (6 Months)

- Launch mobile client, build a richer lineage and audit viewer, implement auto-scaling scaling compute, and begin SOC 2 compliance preparation.

Later (12-18 Months)

- Enable self-training on sanitized, cross-tenant experience vectors and launch a department/agent marketplace to create a platform ecosystem.

Join Us

The Ask

We are seeking strategic pilot partners and pre-seed investors to help us scale the world's first AI Vice President.

Ideal Use Cases

- Autonomous operations
- Governed R&D and analysis
- Compliance and audit automation
